PHONE NUMBER : 01 43 94 72 64

GENERAL INFORMATION

In 2022, ATIBT carried out 12 life cycle inventories (LCI) for the main wood products from the Congo Basin manufactured by its members managing certified forests

This document provides a simplified reading of the results of the Life Cycle Assessment (LCA) of certified wood battens from the Congo Basin available in a port on the West African coast with 2 key indicators: the Climate Change indicator and the Quantity of Biogenic Carbon Stored.

The results of the life cycle inventories were obtained from data collected over 3 years (2018 - 2019 - 2020) at 4 ATIBT member companies:

- INTERHOLCO (Republic of Congo)
- PALLISCO CIFM (Cameroon)
- PRECIOUS WOOD (Gabon)
- ROUGIER (Gabon)

AIM OF THE STUDY

This study was performed according to ISO 14 040/44 and NF EN 15 804+A2 and was critically reviewed by an external independent reviewer.

The present LCIA has been established in a specific context, aiming to come as close as possible to compliance with the NF EN 15804+A2 standard, but within a partial perimeter: from the forestry operation to the shipping port. This LCIA is a preparatory and essential work for the realization of future FDES / EPD of tropical wood products. These will incorporate modules C and D and will therefore be irreproachable.

This LCI is not intended to be published under any particular program (INIES, IBU...).

You can download the LCI directly from the ATIBT website: **https://www.atibt.org/fr**

LCIA – BATTENS

FURTHER INFORMATION

DECLARED UNIT: "To produce 1 m^3 of packaged battens available in a port on the West African coast".

RIGHTS HOLDERS: Every ATIBT member companies that produce tropical wood battens from sustainably managed forests (certified wood). Customers of ATIBT members will be able to use these LCIA to make their environmental declaration (EPD / FDES or other LCA).

VERIFICATION DATE OF THE LCIA: June 2022 **VALIDITY DATE:** June 2032

MAIN RESULTS:

CLIMATE CHANGE	BIOGENIC CARBON STORED
-914 (kg eq. CO_2/m^3)	406 **(kg of C/m^3)**

COMMONLY USED TREE SPECIES: Bilinga, Okan and Azobé

VALIDITY FRAME:

The validity framework for using the LCIA for battens is detailed below:

Parameter	Range of variation covered
Certification	Wood coming from forests applying sustainable management production schemes at 100% (FSC, PEFC…)
Density	Up to 1060 kg/m3
Diesel consumption during the skidding	Lower than 12 L/m3
First transformation diesel consumption	Lower than 100 kWh/m3
Distance to the harbour	Lower than 1 000 km by truck and 1 300 km all transportation types included.
First transformation yield	Higher than 30% as an average
Diesel consumption during second transformation	Lower than 300 kWh/m3

WARNING AND COMPARABILITY

LCIA may not be comparable if they do not comply with EN 15804+A2, are not established on the same harmonised scientific basis and do not concern the same functional units.

LCIA – BATTENS

WOOD FROM SUSTAINABLY MANAGED FORESTS

Using FSC or PEFC certified wood means:

- ensure that the wood comes from sustainably managed forests: https://www.atibt.org/
- refuse to participate in the artificialisation of land
- harvesting trees responsibly so as not to disrupt the ecosystem

How are the benefits of sustainably managed forests taken into account in LCA-type environmental calculations?

Wood is a material that captures carbon when it grows. In LCA, when a biobased resource is managed sustainably, the CO_2 capture is considered a negative emission that lowers the environmental impacts. Wood from non-sustainably managed forests does not benefit from this negative emission.

MORE DEMAND FOR EPD

To date, manufacturers are not obliged (mandatory by law) to provide EPDs. Though, the market increasingly for proof of the environmental impact through type III environmental declaration, therefore EPDs. From EU regulations which intends to increase the need of environmental value for each build products, to label schemes such as BREEAM, LEED or HQE, EPDs aim to help the manufacturers to prove their environmental claims. Also, it has become a real need to access to the market in such countries as France or Belgium.

Tropical woods tend to be woods with high densities. The higher the density of a wood is, the more biogenic carbon it stores. This biogenic carbon storage is beneficial to biobased products and results in negative impacts on the climate change indicator.

For example, 1 m^3 of standing Bilinga is equivalent to a capture of 1244 kg eq. CO_2 (calculation carried out according to the NF EN 16485 standard). At the end of its life, only 57% will be considered as re-emitted according to the dynamic calculation. In total, 1 m^3 of Bilinga therefore represents -525 kg eq. CO_2 on the french environmental regulation (RE2020) threshold indicator, excluding the production and transport stages.

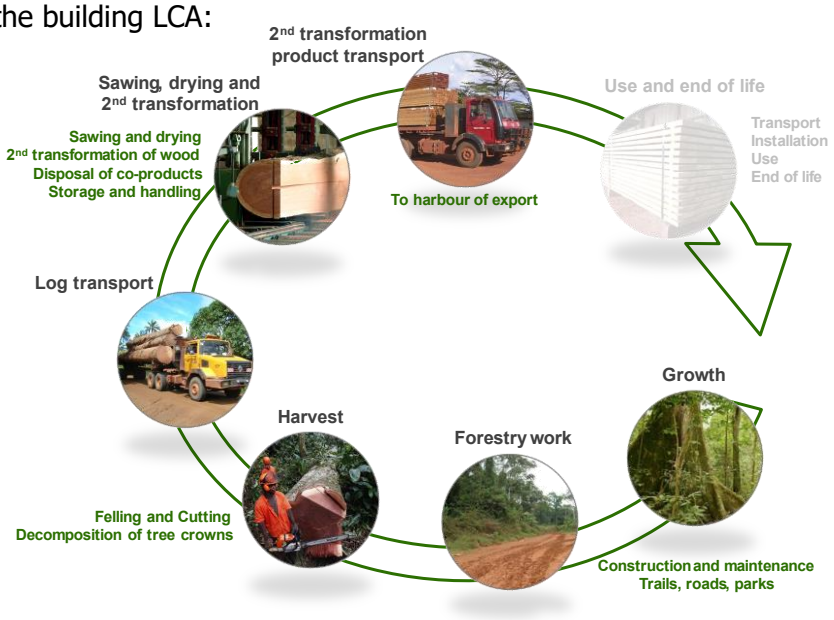
LIFE CYCLE STAGES COVERED

The following stages are covered by the impact of the LCA, those in transparency have to be added for integration into the building LCA:



SYNTHETIC RESULTS

ENVIRONNEMENTAL IMPACTS		
Climate change - total	kg of CO_2 eq..	**-9,14E+02**
Climate change - fossil	kg of CO_2 eq..	**5,72E+02**
Climate change - biogenic	kg of CO_2 eq..	**-1,49E+03**
Climate change -land use and land use change	kg of CO_2 eq..	**5,13E-01**
Ozone layer depletion	kg of CFC-11 eq..	**9,92E-05**
Acidification potential	mole of H^+ eq..	**8,58E+00**
Eutrophication (aquatic freshwater)	kg of PO_4^{3-} eq..	**4,77E-02**
Eutrophication (aquatic marine)	kg of N eq..	**3,93E+00**
Eutrophication (terrestrial)	mol of N eq..	**4,30E+01**
Photochemical ozone creation potential	kg of NMVOC eq..	**1,74E+01**
Depletion of abiotic resources - elements, ultimate reserves	kg of Sb eq..	**1,56E-03**
Depletion of abiotic resources - fossil fuels	MJ	**6,56E+03**
Water use	m3 of privation eq.	**1,02E+02**
Potential incidence of disease due to PM emissions	Disease incidence	**1,99E-04**
Potential Human exposure efficiency relative to U235	kBq of U235 eq..	**3,11E+01**
Potential comparative toxic unit for ecosystems	CTUe	**1,97E+04**
Potential comparative toxic unit for humans - cancerogenic	CTUh	**3,74E-05**
Potential comparative toxic unit for humans - not cancerogenic	CTUh	**2,06E-04**
Potential soil quality index	dimensionless	**1,53E+06**
