

Sustainable forest management in Indonesia

2010: Less than 1 million ha FSC certified

Bottlenecks 2010

- Scattered support initiatives
- Lack of staff capacity for certification
- Limited external expertise
- High costs
- Prolonged time frame
- Insecure market prospects

Approach 2010

- Unified support services platform
- Certification coaches
- Subject matter specialist training
- Co-funding
- Fast-track process
- Marketing support activities

What's next?

Bottlenecks 2020

- Price premium for FSC certified products has eroded
- Regional markets China, India are becoming increasingly important and these do not normally require FSC certification
- COVID 19 pandemic accelerates long-term decline in the sector and The Boneo Initiative estimates that well over 50% of the concessions is inactive
- Most companies have maintained certification so far, but there is an increasing fall-out risk
- Large scale agricultural development increases pressure on the (forest)land

Approach 2020

- New regulation allows concessions to become multi-purpose enterprises and combine logging with forest restoration, tree plantation (fastgrowing species), conservation and agriculture
- Multi-purpose companies have a higher revenue potential and reduced cash-flow problems during early investment period. Carbon revenues can have a major influence on feasibility.
- Multi-purpose companies are potentially interesting for green investors (loans, equity) if they adopt a landscape approach and support smallholders. FSC certification typically is a first requirement and facilitates access to preferential loans and additional grants

fern with species.

- Business model development for multipurpose enterprises
- Optimization of land-use
- Low-carbon development
- High management requirements
- Transformation that can be implemented step-wise
- Attractive for combination of loans and grants
